

Professional Resume

Personal Information

Name: Li Bai	Gender: Male
Age: 29	Phone: 1871-000-4539
Email: wl1548example@163.com	Degree: Bachelor's Degree
Target Role: Python Backend Engineer	Current Location: Chaoyang District, Beijing
Hometown: Hanzhong, Shaanxi	Salary Expectation: Negotiable
Open to Work: Yes	Years of Experience: 6

Professional Skills

- ☐ Proficient in Python backend development with 6 years of industry experience
- ☐ Expert in web framework development using Django, Flask, and FastAPI
- ☐ Skilled in designing robust RESTful APIs and microservices architectures
- ☐ Proficient in database design and optimization for MySQL and PostgreSQL
- ☐ Experienced with caching mechanisms and message brokers including Redis and Celery
- ☐ Proficient in containerized application deployment with Docker and Kubernetes
- ☐ Strong command of Linux environments and infrastructure automation
- ☐ Experienced in version control management and collaboration workflows using Git
- ☐ Proficient in CI/CD pipeline implementation and continuous integration practices
- ☐ Knowledgeable in web server configuration and reverse proxy setup with Nginx
- ☐ Capable of developing LLM integrations, RAG pipelines, and vector database operations
- ☐ Skilled in creating testing scripts and performing load and stability analysis

Certifications

National Computer Rank Examination Level 2	2017	Official Examination Authority
Mandarin Certificate	2017	Official Examination Authority

Work Experience

LLM Application R&D; Engineer	Ganyi Intelligent Technology Co., Ltd.	10/2024 Present
Python Developer	Beijing Xinniu Technology Co., Ltd.	08/2022 07/2024
Python Developer	Beijing Meixin Times Technology Co., Ltd.	08/2020 06/2022
Python Developer	Chinasoft International Co., Ltd.	05/2018 06/2020

Education

09/2013 06/2017	North China University of Science and Technology	Metal Material Engineering
-----------------	--	----------------------------

Project Experience

RAG Intelligent Customer Service System

Project Des A retrieval augmented generation customer service QA system combining cription: external knowledge bases and LLMs to answer user queries.

Tech Stack: Python, FastAPI, LangChain, Elasticsearch, Kubernetes

Responsibil ities:

1. Collected, cleaned, and standardized raw documents for ingestion into the knowledge base.

2. Split text, created embeddings, and stored vectors to enable semantic search capabilities.
3. Ran batch jobs on millions of historical QA records to evaluate accuracy, recall, and response time.
4. Wrote load testing and stability testing scripts to validate system performance.

Highlights:

1. Built a data access system supporting different knowledge base types.
2. Added resumable processing for very large batch tasks to prevent failure.
3. Improved QA accuracy with intent recognition, similar questions matching, and reranking.

RPA Workflow Automation Platform

Project Des A platform utilizing software robots to automate repeated business cription: operations across various applications.

Tech Stack: Python, Flask, SQLite, Docker, Linux

Responsibil
ities:

1. Developed modules for the designer, attended client, and unattended client interfaces.
2. Built reusable workflow components for email, Word, Excel, table, and database operations.
3. Managed client upgrade features and ensured backward compatibility during updates.
4. Utilized asynchronous libraries for efficient chunk upload and download operations.

Highlights:

1. Implemented scheduled robot task management using APScheduler.
2. Created reusable workflow components to reduce development time for new automations.
3. Supported unattended execution modes for high-volume background processing.

Operations Monitoring Platform

Project Des A system monitoring network devices, servers, storage, and security cription: devices to display collected metrics for users.

Tech Stack: Python, Django REST Framework, MySQL, RabbitMQ, Linux

Responsibilities:

1. Developed device report modules and self-monitoring functions for system health.
2. Investigated and fixed production problems to maintain high availability.
3. Supported distributed data collection and second-stage filtering before storage.
4. Implemented host-level monitoring for CPU, disk, connections, and MQ backlog indicators.

Highlights:

1. Added one-click export of monitoring metrics with visual charts.
2. Enabled real-time visibility into server and network device status.
3. Optimized data ingestion pipelines to handle high-frequency monitoring data.

Cloud Product Integration Deployment Script

Project Des A script project handling conversion between standard products and cription: cloud-integrated versions including installation and configuration.

Tech Stack: Python, MySQL, Linux, Git

Responsibilities:

1. Developed conversion scripts for installation, reverse proxy setup, and CMDB data push.
2. Performed self-testing, deployment, maintenance, and optimization of automation tools.
3. Used decorators to check whether files were changed before applying updates.
4. Wrapped configparser operations for centralized configuration management.

Highlights:

1. Automated service start and stop procedures during cloud integration.
2. Used threading and multiprocessing to replace frontend routes in batches.
3. Streamlined the deployment process reducing manual intervention requirements.

Professional Summary

Results-driven Python Backend Engineer with six years of comprehensive industry experience specializing in building scalable web applications and microservices architectures. Proficient in core frameworks including Django, Flask, and FastAPI,

with deep expertise in designing robust RESTful APIs and optimizing database performance using MySQL and PostgreSQL. Skilled in leveraging caching mechanisms like Redis and message brokers such as Celery to ensure high availability and system efficiency. Recently expanded technical capabilities into artificial intelligence by developing LLM integrations and Retrieval Augmented Generation pipelines using vector databases and Kubernetes. Strong background in infrastructure automation, containerized deployment with Docker, and CI/CD pipeline implementation within Linux environments. Proven track record at leading technology firms managing complex projects ranging from intelligent customer service systems to RPA workflow automation platforms, successfully improving QA accuracy and system response times across multiple enterprise deployments. Demonstrates a meticulous approach to software quality through rigorous load testing, stability analysis, and version control management using Git while maintaining strict adherence to coding standards. Committed to writing clean code, solving critical production issues, and streamlining deployment processes to reduce manual intervention. Eager to leverage extensive backend development knowledge and emerging AI expertise to drive innovation and deliver high-performance solutions as a Python Backend Engineer within a dynamic team environment.
