

Self Evaluation

Results-driven Python Backend Engineer with six years of comprehensive industry experience specializing in building scalable web applications and microservices architectures. Proficient in core frameworks including Django, Flask, and FastAPI, with deep expertise in designing robust RESTful APIs and optimizing database performance using MySQL and PostgreSQL. Skilled in leveraging caching mechanisms like Redis and message brokers such as Celery to ensure high availability and system efficiency. Recently expanded technical capabilities into artificial intelligence by developing LLM integrations and Retrieval Augmented Generation pipelines using vector databases and Kubernetes. Strong background in infrastructure automation, containerized deployment with Docker, and CI/CD pipeline implementation within Linux environments. Proven track record at leading technology firms managing complex projects ranging from intelligent customer service systems to RPA workflow automation platforms, successfully improving QA accuracy and system response times across multiple enterprise deployments. Demonstrates a meticulous approach to software quality through rigorous load testing, stability analysis, and version control management using Git while maintaining strict adherence to coding standards. Committed to writing clean code, solving critical production issues, and streamlining deployment processes to reduce manual intervention. Eager to leverage extensive backend development knowledge and emerging AI expertise to drive innovation and deliver high-performance solutions as a Python Backend Engineer within a dynamic team environment.
